

Early Ocular Biomechanical Changes after femtosecond-assisted laser refractive cataract surgery

Bruno Valbon, MD; Milton R. Alves, MD, PhD; Bruno Fontes, MD, PhD; Cynthia Roberts, PhD; Luca Gualdi, MD; Renato Ambrósio Jr, MD, PhD.

Dr. Ambrósio is a consultant for Oculus / Cynthia Roberts, PhD is a consultant for Oculus

Rio de Janeiro
Corneal Tomography and
Biomechanics Study Group

Purpose:

- ▶ To describe ocular biomechanical changes in the early post-operative period of patients who underwent femtosecond laser (FL)-assisted cataract surgery and to evaluate the influence of delta intraocular pressure (IOP) measurements and delta central corneal thickness (CCT) on corneal deformation response.

Methods:

- ▶ Retrospective study.
- ▶ 76 eyes of 62 consecutive patients who had FL-assisted cataract surgery.
- ▶ Dynamic ultra-high speed Scheimpflug imaging and Pentacam (Corvis ST *; Oculus, Wetzlar, Germany) were performed prior to surgery and at 1 day postoperatively.
- ▶ The differences of the preoperative and first postoperative day on IOP, CCT and on corneal deformation parameters were assessed using Student T Test or Wilcoxon signed-rank accordingly to the type of distribution (Kolmogorov Smirnov).
- ▶ The percentual change of IOP (delta IOP) and CCT (delta CCT) were correlated to all parameters from Corvis ST.

* The Corvis ST (Scheimpflug Technology), a new non-contact tonometry (NCT) system integrated with an ultra-high-speed (UHS) Scheimpflug camera, was recently introduced by Oculus (Wetzlar, Germany) and provides ocular biomechanical and intraocular pressure information.

Results:

- ▶ Comparision between PRE and D1

* (all parameters from Corvis ST)

- ▶ Wilcoxon test

(Kolmogorov- Smirnov ≤ 0.05)

25 of 28 parameters
were statistically
significant differences
($p \leq 0.05$)

Only 3 parameters
that were not
statistically significant
differences ($p \leq 0.05$)
as A2 Length [mm],
HC Time [ms] and
Deflection Amp. Max
[ms]

Results: Δ parameters from Corvis ST x Δ IOP Corvis ST.

(Δ means : D1 – PRE) example :
 PRE_Def. Amplitude 1.8 mm; D1_Def. Amplitude 1.4;
 $1.4 (\text{D1}) - 1.8 (\text{PRE}) = \Delta = -0.4 \text{ mm}$

$$* \Delta = \text{D1} - \text{PRE}$$

- ▶ Spearman correlation test
- ▶ In red, the parameters that were statistically significant.

IOP [mmHg] (-1;+1)		Pachy apex TOMO	0,9842

Results_resume

- ▶ There were statistically significant differences ($p \leq 0.05$) of CCT, IOP and all parameters from Corvis ST, excluding highest concavity (HC) time, second applanation length and maximal deflection amplitude.
- ▶ Deformation amplitude (DA) and corneal velocities were lower at 1 day compared to preoperatively ($p \leq .0001$). There was a significant increase of CCT (average $80.52 \mu +/ - 33.76$) and of IOP (average $5.42 \text{ mmHg} +/ - 7.56$).
- ▶ There were more significant correlations between corneal deformation parameters and delta IOP than with delta CCT.
- ▶ Measured IOP was negatively associated with deformation parameters such as maximal deformation and deflection amplitude, preoperatively and 1 day postoperatively ($p \leq .0001$).
- ▶ Group 1 (Variation of IOP $\geq 5 \text{ mmHg}$) had higher influences on measurements from deformation cornea by Corvis than group 2 (Variation of IOP $-1\text{mmHg};+1\text{mmHg}$).

Conclusions

- ❖ There is mild edema and mild ocular hypertension in the first day after FS-assisted cataract surgery.
- ❖ The changes of IOP had higher influences with the changes on ocular biomechanics than CCT.
